

AIR EMISSIONS AND PERMITTING

The Clean Air Act (CAA) now touches virtually every aspect of economic activity in the United States. It includes requirements to attain and maintain ambient air quality standards, and may prevent new air pollution sources from being constructed in some locations. The Act provides a comprehensive set of regulations to monitor air toxics and requires major sources of air pollution to have detailed operating permits.

We help industrial, commercial, and institutional clients comply with the CAA. We determine how the CAA affects our clients' operations and what the practical strategies are for meeting the requirements. We understand the uses and limitations of agency guidance, and our experience in a number of industries provides us with proven, industry-specific approaches to measuring emissions and maintaining compliance.

OUR AIR EMISSIONS AND PERMITTING PRACTICE

- Emission inventories
- Atmospheric Dispersion Modeling
- Permit applications and technical negotiations in support of permitting
- Air pollution control design, installation, operations and maintenance
- Technical support for New Source Review
- Risk management plans and contingency plans
